

In an effort to give you all an idea of how correct your homework is, I've decided to include an example of what your program should output given some specific images.

Here is the image being manipulated(from "Rhythm Thief and the Emperor's Treasure"):

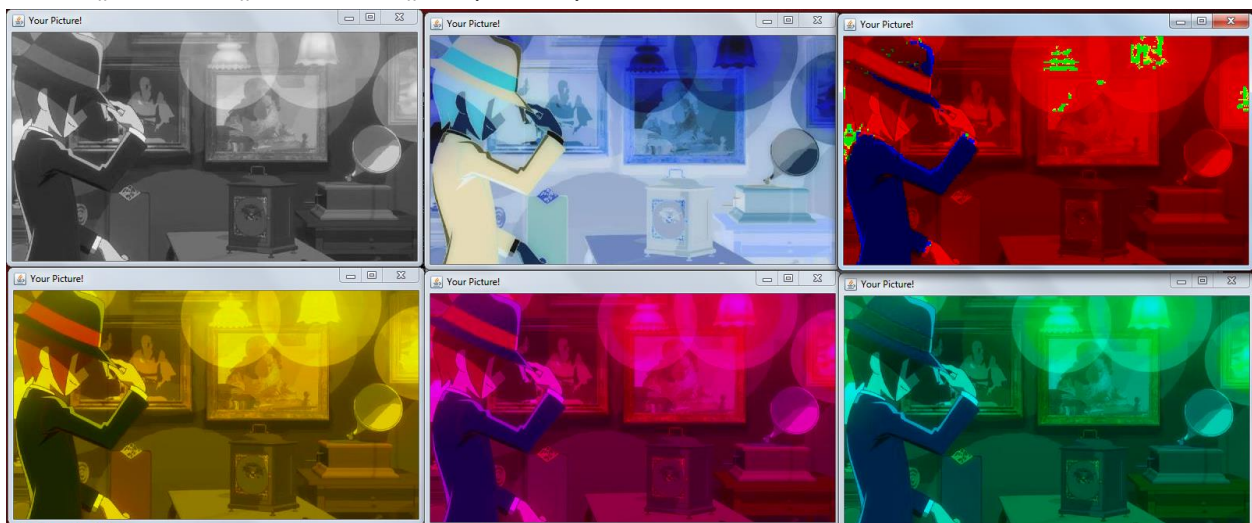

Here are two watermarks, one bigger and one smaller than the image above:

WATER MARK
GO !!!

WATER MARK
GO !!!

Given these images, this is what your program should output for greyscale(), invert(), maximize(), noBlue(), noGreen(), and noRed(), respectively:

On the left is what your program should output on the bigger watermark.

On the right is that your program should output on the smaller watermark.
